

AI Chatbot Report

Introduction

An AI chatbot is a software application that uses artificial intelligence to communicate with users through text or voice. It can answer questions, provide information, and automate conversations.

How AI Chatbots Work

AI chatbots process user input using Natural Language Processing (NLP), understand the intent, and generate relevant responses using machine learning or large language models.

Applications

Customer support, education, healthcare, banking, e-commerce, and virtual assistants.

Advantages

24/7 availability, faster responses, improved customer experience, reduced costs, and automation of repetitive tasks.

Conclusion

AI chatbots are transforming communication by making services faster, smarter, and more accessible.
